Insecta Mundi is a journal primarily devoted to insect systematics, but articles can be published on any non-marine arthropod. Topics considered for publication include systematics, taxonomy, nomenclature, checklists, faunal works, and natural history. **Insecta Mundi** will not consider works in the applied sciences (i.e. medical entomology, pest control research, etc.), and no longer publishes book reviews or editorials. *Insecta Mundi* publishes original research or discoveries in an inexpensive and timely manner, distributing them free via open access on the internet on the date of publication.

Insecta Mundi is referenced or abstracted by several sources including the Zoological Record, CAB Abstracts, etc. **Insecta Mundi** is published irregularly throughout the year, with completed manuscripts assigned an individual number. Manuscripts must be peer reviewed prior to submission, after which they are reviewed by the editorial board to ensure quality. One author of each submitted manuscript must be a current member of the Center for Systematic Entomology.

Abstract. *Cixidia fusca* and *Synecloche impunctata* (Hemiptera: Achilidae) are reported from Missouri for the first time, **new state records**. Ecological and trapping information is also provided.

Key Words. New record.

Introduction

The family Achilidae contains eight genera and 55 species in North America (Bartlett et al. 2014). Of these, two genera (*Cixidia* and *Catonia*) comprising seven species were known to occur in Missouri. Presented here are the first records of the species *Cixidia fusca* (Walker) and the genus and species *Synecloche impunctata* (Fitch) from Missouri, extending their Midwestern ranges.

Materials and Methods

All specimens were collected as bycatch in purple 12-unit Lindgren funnel traps baited with wood-boring beetle lures. Both traps were hung in young oak (*Quercus* spp.; Fagaceae) trees in Shannon County, Missouri. Traps were located near the peak of Southwest-facing slopes with canopies primarily composed of scarlet (*Q. coccinea* Muenchh.), black (*Q. velutina* Lam.), and white oak (*Q. alba* L.), hickories (*Carya* sp.; Juglandaceae), and shortleaf pine (*Pinus echinata* Mill.; Pinaceae). The understory canopy included sassafras (*Sassafras albidum* (Nutt.) Nees; Lauraceae), dogwood (*Cornus florida* L.; Cornaceae), red maple (*Acer rubrum* L.; Sapindaceae), black gum (*Nyssa sylvatica* Marshall; Cornaceae), and Carolina buckthorn (*Rhamnus caroliniana* Walter; Rhamnaceae).

Two specimens (1♂, 1♀) of *S. impunctata* were collected July 1, 2016 at 37.25381°N -91.38206°W from a trap hung on a white oak (*Q. alba*). A single female specimen of *C. fusca* was collected on May 21, 2016 at 37.25594°N -91.39143°W from a trap hung on a scarlet oak (*Q. coccinea*). All specimens were collected by the author (CMC) and stored in 100% ethanol until identification; they will be retained in the Pennsylvania Department of Agriculture's collection [PADA].

Results

Synecloche impunctata has a primarily eastern distribution that includes four states adjacent to Missouri: Iowa, Illinois, Oklahoma, and Tennessee. *Synecloche impunctata* can be distinguished from other North American *Synecloche* by its pale frons with large dark brown spots, tegmina without transverse veinlets, and features of the male genitalia (O'Brien 1971).

The known range of *C. fusca* is more disjointed, with no reported states adjacent to this Missouri record. It is currently reported from AL, CO, DC, DE, FL, GA, LA, MD, MN, MS, NC, NJ, NM, NY, PA, RI, TX, VA, and WI as well as from Ontario, Quebec, and Puerto Rico (Bartlett et al. 2014). *Cixidia fusca* can be distinguished from other North American *Cixidia* by its dark brown frons with a light brown band in the middle third (Bartlett 2017).

Acknowledgments

The authors are grateful to the L-A-D Foundation for permitting us to collect from their land, and to Neal Humke for his assistance with trap servicing. The authors thank Gregory Setliff and Steve Wilson for revisions to this manuscript.
